EEG study on the perception of spatialized sounds

Behavior | EEG | Auditory virtual reality | 1 visit | ~1h45

Why this research?

This study investigates the perception of virtually spatialized sounds through **auditory virtual reality**, by the analysis of behavioral responses and brain activity using **electroencephalography**, a non-invasive brain imaging technique. This work could contribute to improving the evaluation of patients suffering from **disorders of consciousness**.

Process

- **EEG cap (24 electrodes with gel**, non-invasive, shampoo available)
- **Audio headset**
- **Spatialized sounds perception tests**
- Mild **electrical stimulation**
- **Short questionnaires**

Practical information

- **1 single visit**
- **Duration: approximately 1h45**
- **Compensation: €20 by bank transfer**
- **Location: CRNL - COPHY Team**
  Building 452, East Hospital Group
  40 Bd Pinel, 69500 Bron

To participate

- ✓ Be between **18 and 60 years old**
- ✓ Be **right-handed**
- ✓ Have **normal hearing**
- ✓ Have **normal or corrected** vision
- ✗ Neurological or psychiatric disorders
- ✗ Psychotropic consumption <24 hours before
